(a) homogeneous blowup, $\tau_* = 0.5,\ \delta = 1$
$(T-t)\,\theta_t$
reduced
full
$T - t$
(b) reduced: $\|\Psi(\tau) - \Psi_a\|$
exact (Liouville)
numerical, $\gamma = 0$
numerical, $\gamma = 1$
$\propto e^{-\tau}$
$\tau = -\log(T-t) + \log T$
(c) $e^{\tau}\,\|\Psi(\tau) - \Psi_{\lim}\|$
full, $\gamma = 0$ ($v = -0.057$)
full, $\gamma = 1$ ($v = -0.093$)
reduced (Liouville)
reduced, $\gamma = 1$
