(a) homogeneous blowup, $\tau_r = 0.5,\ \delta = 1$
reduced: $\theta + 2\log(T-t)$
full: $\theta + \log(T-t)$
$T - t$
(b) reduced: $\|\Psi(\tau) - \Psi_a\|$
exact (Liouville)
numerical, $\gamma = 0$
numerical, $\gamma = 1$
$\propto e^{-\tau}$
$\tau = -\log(T-t) + \log T$
(c) full Cattaneo: $\|\Psi(\tau) - \Psi_v\|$
full, $\gamma = 0$
full, $\gamma = 1$
$\propto \tau e^{-\tau}$
$\propto e^{-\tau}$
